### **Lab 8: Socket Programming**

---

**AIM:** To implement Socket Programming and establish a connection between client and server.

#### **THEORY:**

Socket programming is a way of connecting two nodes on a network to communicate with each other. One socket(node) listens on a particular port at an IP, while other socket reaches out to the other to form a connection. Server forms the listener socket while client reaches out to the server. They are the real backbones behind web browsing. In simpler terms there is a server and a client.

#### **CODE:**

- **server.py** import socket

```
s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
s.bind((socket.gethostname(), 8000))
s.listen(5)
```

```
while True:
```

```
    clientsocket, address = s.accept()
    print(f'Connection established with {address}')
    clientsocket.send(bytes('Hello World!', 'utf-8'))
    clientsocket.close()
```

- **client.py** import socket

```
s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
s.connect((socket.gethostname(), 8000)) msg = s.recv(1024)
print(msg.decode('utf-8'))
```

#### **OUTPUT:**

- **client.py**

```
C:\Users\vroon\Desktop\DCC>python client.py  
Hello World!
```

- **server.py**

```
C:\Users\vroon\Desktop\DCC>python server.py  
Connection established with ('192.168.1.8', 54707)
```

## **CONCLUSION:**

I understood how to successfully establish a connection between client and server using socket programming.
